

## Pioneering technology options for the best results

### As the first UK clinician with a practice dedicated to invisible lingual braces - Asif is often among the first to use new technology.

As a result, dentists who refer to Asif can expect their patients to benefit from the best and most effective braces. The newest systems have CadCam technology and customized brackets and these allow for the movement of each tooth to be planned in minute detail. Another benefit of individual brackets is that they can be kept small, so interference with speech and discomfort are minimised. Asif will discuss the choices and recommend the best system for you.

#### Orapix

The latest system, Orapix allows the orthodontist to design your braces electronically so that the brackets fit each tooth individually.

*Tooth movement can be planned in fine detail*

#### Incognito

Like Orapix, the brackets are 100 per cent customized to the patient. Made from gold alloy, the brackets are thin and barely disrupt your speech.

*The gold alloy brackets of Incognito are exceptionally strong so the brackets can be kept thin.*

#### Invisalign

Invisalign is for mild problems and consists of a series of aligner trays made especially for you, based on a computerised prediction of how your teeth need to move. Every few weeks you change the aligner so that your teeth are gradually moved to their new position.

#### STb

Another customized system, STb uses light forces to move the teeth. As with all lingual systems, the fit and comfort are optimum.

#### Aceledent

Aceledent provides a faster route to a new smile. It is placed on the teeth and mild vibrations help accelerate teeth movement. Aceledent is suitable for any patient wearing orthodontic braces and early reports suggest it shortens treatment time considerably.

*Aceledent is a hands-free gadget which can be used for 20 minutes a day while you are on the computer, watching TV or listening to music.*
